**Research Paper in Progress:**

**“The Economic Value of Crime Control”**

What is the willingness to pay to reduce exposure to crime? Applying a research design based on the openings and closings of police stations in Colombia, I study the effects of public safety improvements on crime and its economic benefits. In particular, I quantify the relationship between a reduction in violent and non-violent offenses, and the change in the prices of nearby residential properties.

**“Do Rebel Groups use violence strategically for electoral purposes?”**

Do rebel groups use electoral violence strategically? There is evidence that, in civil wars, places with valuable natural resources are prone to experience higher levels of violence. What is less known is that electoral violence increases disproportionately in areas with natural resources that are easier to predate. In this paper, I present evidence of rebel groups using violence strategically during electoral years. My identification strategy relies on a Differences in Differences (DD) design that compares commodity producing with nonproducing municipalities during electoral and non-electoral years. The main findings are violence increases during elections, places with natural resources experience higher levels of conflict and electoral violence increases disproportionately in locations with loot-able or obstruct-able natural resources (oil and gold). These results are in favor of the hypothesis that rebel groups use violence strategically during elections and point out an additional channel through which the resource curse operates.

**Seminar and Conferences:**

“Annual Fall Research Conference”. **Association for Public Policy Analysis and Management (APPAM)**. November 8-10, 2018. Washington. DC, United States (Presenting).
